CLAIMS

We claim:

35

13

prokaryotic RecA protein.

14. The composition of Claim 12, wherein said RecA protein species is *E. coli* RecA.

The composition of Claim 12, wherein said prokaryotic recombinase is a species of

	15.	The composition of claim 1, wherein said recombinase is a species of eukaryotic recombinase.
	16.	The composition of claim 18, wherein said recombinase is a Rad51 recombinase.
	17.	The composition of claim 15, wherein said eukaryotic recombinase is a complex of recombinase proteins.
	18.	The composition of claim 1 wherein at least one of said single stranded nucleic acids contains at least one substituent.
	19.	The composition of claim 18 wherein said substituent is a chemical substituent.
	20.	The composition of claim 18 wherein said subetituent is a protein.
	21.	The composition of claim 18 wherein said substituent is selected from the group consisting of intercalators, cross-linking moieties, labels, photoactive moieties, nucleic acid scission inducing moieties, purification moieties, and nucleic acid modification moieties.
	22.	A composition comprising a double D-loop comprising a target nucleic acid and two substantially complementary single stranded targeting polynucleotides, each containing: a) at least one homology clamp that substantially corresponds to or is substantially complementary to a preselected target nucleic acid sequence of said target nucleic acid; and
25		b) at least one anchoring sequence.
30	23.	The composition of claim 22 further comprising a secondary probe, wherein said probe is substantially complementary to at least one of said anchoring sequences.
	24.	The composition of claim 22 wherein said anchoring sequences form a triplex anchor.
	25.	The composition of claim 22 wherein said anchoring sequences form a quadruplex anchor.
	26.	The composition of claim 22 wherein said anchoring sequences form a Z-DNA anchor.
35	27	The composition of claim 22 wherein said anchoring sequences form a B-DNA anchor.
PAB13>	28.	The composition of claim 22 wherein said anchoring sequences form an A-DNA anchor.

The composition of claim 22 wherein said anchoring sequences comprise RNA.

29.

30. The composition of claim 22 wherein said anchoring sequences comprise DNA.

5

10

35

40

31. The composition of claim 22 wherein at least one of said targeting polynucleotides comprises protein-nucleic acid.

32. The composition of claim 22 wherein said anchoring sequences comprise DNA and RNA.

33. The composition of claim 22, wherein said recombinase is a species of prokaryotic recombinase.

34. The composition of Claim 33, wherein said prokaryotic recombinase is a species of prokaryotic RecA protein.

- 35. The composition of Claim 33, wherein said RecA protein species is *E. coli* RecA.
- 36. The composition of claim 22, wherein said recombinase is a species of eukaryotic recombinase.
- 37. The composition of claim 36, wherein said recombinase is a Rad51 recombinase.
- 38. The composition of claim 36, wherein said eukaryotic recombinase is a complex of recombinase proteins.
- 39. The composition of claim 22 wherein at least one of said single stranded nucleic acids contains at least one substituent.
- 40. The composition of claim 39 wherein said substituent is a chemical substituent.
- 41. The composition of claim 39 wherein said substituent is a protein.
- The composition of claim 40 wherein said substituent is selected from the group consisting of intercalators, cross-linking moieties, labels, photoactive moieties, nucleic acid scission inducing moieties, purification moieties, and nucleic acid modification moieties.
- 43. A composition comprising a double D-loop comprising a target nucleic acid and a single stranded targeting polynucleotides comprising a first homology clamp that substantially corresponds to a preselected target nucleic acid sequence, a second homology clamp that is substantially complementary to said preselected target nucleic acid sequence, and at least one anchoring sequence.

	44.	The composition of claim 43 further comprising a secondary probe, wherein said probe is substantially complementary to at least one of said anchoring sequences.
	45.	The composition of claim 43 wherein said anchoring sequences form a triplex anchor.
	46.	The composition of claim 43 wherein said anchoring sequences form a quadruplex anchor.
	47.	The composition of claim 43 wherein said anchoring sequences form a Z-DNA anchor.
	48.	The composition of claim 43 wherein said anchoring sequences form a B-DNA anchor.
	> 49.	The composition of claim 43 wherein said anchoring sequences form an A-DNA anchor.
	50.	The composition of claim 43 wherein said anchoring sequences comprise RNA.
	51.	The composition of claim 43 wherein said anchoring sequences comprise DNA.
	52.	The composition of claim 43 wherein at least one of said targeting polynucleotides comprises protein nucleic acid.
	53.	The composition of claim 43 wherein said anchoring sequences comprise DNA and RNA.
	54.	The composition of claim 43, wherein said recombinase is a species of prokaryotic recombinase.
	55 .	The composition of Claim 54, wherein said prokaryotic recombinase is a species of prokaryotic RecA protein.
30 35	56.	The composition of Claim 55, wherein said RecA protein species is <i>E. coli</i> RecA.
	57.	The composition of claim 43, wherein said recombinase is a species of eukaryotic recombinase.
	58.	The composition of claim 57, wherein said recombinase is a Rad51 recombinase.
	59.	The composition of claim 57, wherein said eukaryotic recombinase is a complex of recombinase proteins.

The composition of claim 43 wherein at least one of said single stranded nucleic acids

contains at least one substituent.

complementary to said disease gene; and

at least one homology clamp that substantially corresponds to or is substantially

at least one anchoring sequence; whereby b) said disease state is treated. 90. A method of detecting a double stranded nucle/c acid target sequence comprising: adding a composition comprising at least one recombinase and two substantially complementary single stranded targeting polynucleotides, each containing: at least one homology clamp that/substantially corresponds to or is substantially complementary to a preselected/target nucleic acid sequence; and at least one anchoring sequence; to a sample containing said target sequence under conditions which allow the formation of a double-D loop; and detecting the presence of said double-D loop. The method of claim 90 wherein said target sequence is contained within a cell. 91. The method of claim 90 wherein/at least one of said single stranded nucleic acids comprises a 92. substituent. 93. The method of claim 90 wherein said substituent is a label. 94. A method of isolating either strand of a double stranded target sequence comprising: adding a composition comprising at least one recombinase and two substantially complementary single stranded targeting polynucleotides, each containing: at least one homology clamp that substantially corresponds to or is substantially complementary to a preselected target nucleic acid sequence; and at least one anchoring sequence: to a sample containing said target sequence under conditions which allow the formation of a double-D loop; and isolating said double-D loop. 95. The method of claim 94 further comprising cloning said target sequence.

97. The method of claim 94 further comprising sequencing all or part of said target sequence.

double-D loop

98. The method of claim 94 wherein at least one of said targeting polynucleotides comprises at least one substituent.

The method of plaim 94 further comprising removing said targeting polynucleotides from said

The method of claim 98 wherein said substituent is a purification moiety. 99. 100. A method of isolating either strand of at least one Inember of a gene family comprising: adding a composition comprising at least on recombinase and at least two substantially complementary single stranded targeting polynucleotides, each containing: at least one homology clamp that substantially corresponds to or is substantially complementary to a preselected target nucleic acid sequence, wherein said preselected sequence is a motif shared by the members of said family; and ii) at least one anchoring sequence; to a sample containing said target sequence under conditions which allow the formation of a double D-loop; and detecting the presence of said double D-loop; whereby said member of said gene family is isolated. 101. The method of claim 100 wherein more than one member of said gene family is isolated. 102. The method of claim 101 further comprising cloning said member of said gene family. 103. The method of claim 100 wherein at least one of said two substantially complementary single stranded targeting polypycleotides comprises at least one substituent. 104. The method of claim 10/3 wherein said substituent is a purification moiety. 105. A method of producing a transgenic non-human organism comprising: introducing into a donor nucleus at least one recombinase and two substantially complementary single stranded targeting polynucleotides, each containing: at least one homology clamp that substantially corresponds to or is substantially complementary to a preselected target nucleic acid sequence; and at least one anchoring sequence: b) transplanting said nucleus into an oocyte to produce a recombinant zygote; and C) producing a transgenic organism from said recombinant zygote. 106. A method of producing a transgenic plant comprising: introducing into a zygote at least one recombinase and two substantially complementary single stranded targeting polynucleotides, each containing: at least one homology clamp that substantially corresponds to or is substantially

b) producing a transgenic plant from said zygote.

at least one anchoring sequence;

under conditions which allow formation of a double D-loop;

complementary to a preselected target nucleic acid sequence; and

structure

and a protein bound to said anchoring structure.
